

OUR AIMS

WHAT QUELYPHARM AIMS TO DO?

The actual level of information/education among elderly regarding medications and their correct use is often not satisfying. Elderly should be educated and well-informed about health in order to maintain a perfect functionality of their body and to achieve a good quality of life. Health education is a concept directly linked to health promotion in both clinical and educational preparation field. In fact, health education is a key element in the development of health promotion. As part of Department of Drug Science and Technology, we daily take care of medication and good practices of health education. We use *in silico* to the most advanced nanotechnological formulation.

Our profession of drug experts aims to the objective of discovering, improving and knowing better the medication besides the traditional use. Through our work we investigate the intervention of the drug on different systems that dominate the physiology of the human body. In recent years, we consolidated our specialized knowledge and we strongly acknowledged that it is important to optimize the use of medication to guarantee the Quality of Life of the Elderly.

According to this proposition, some colleagues of DSTF of the university of Turin have composed a work group that share the same vision. This project, Qualification of Elderly Polypharmacy – **QuElyP** – has been accepted by Research European Commission – EIP on AHA – AG A1: Prescription and Adherence to Medication. In particular, **QuElyP**

QuElyP realizes the effort, that is the commitment of the Department of Drug Science and Technology (DSTF) of University of Turin. Results and reflections emerging from this work can involve any therapy of the elderly, but also can be useful for health care.
